- Conclusion

Introduction to CHLStats.com

- Background in Machine Learning
- Blogging on CanucksArmy.com
- Interest in Draft Analytics and Prospect Prediction
- Developed CHLStats.com to further access to statistics at

the major junior level

• "Extra Skater" of Prospect Stats

Technologies

- Language: Python 2.7
- Framework: Flask 0.10
- Scraping: BeautifulSoup 4 with lxml
- Database: sqlite3
- Server side: wsgi on nginx
- Host: PythonAnywhere

Features – Team Statistics

CHLStats.com WHL OHL QMJHL Players WJC2015

OHL 2014-2015 Statistics

<< 2013-2014

Credit: M. Pfeffer

Issues

- Poorly written HTML (harder to parse)
- Future changes to HTML will likely break tools
- Post-game changes to game data, difficult to adapt
- Slow websites (WHL.ca)
- Loading data with AJAX
- Untrustworthy data (e.g. height, scorer bias)
- Leagues will change game IDs (WHL)
- Partial Data (WHL shots)
- On ice data states varies between arena
- Player names and spelling is not always consistent
- Reordering names, player names with spaces
 - e.g. Vande Sompel, Mitchell. "Mitchel Vande Sompel"
 - e.g. Fournier, Jordan Ty. "Jordan Ty Fournier"

Future Statistics

- Statistics currently available to be implemented:
 - Player QoC, QoT
 - Vollman's Usage Charts Variants
 - Hockey-Reference's Goals Created
 - WAR
 - ES Scoring
 - Common Line Mates / Pairing Partners
 - Biological Metrics (Height / Weight)
- Team Level
 - Penalty Differentials
 - Pythag / Expected Win %
 - Strength of Schedule
- Goalie Data: Vollman's QS%, GSAA

Projects

- Machine Learning Game Predictions
 - Higher upper bound (~70%) vs NHL (64%)
- Drafting Inefficiencies
 - "Sham Sharron"
 - PPG vs CSS Ranks
- Height + PPG Success Binning
 - Credit (@MoneyPuck_)
- Era/Age Adjusting Points/Game
 - Credit: Rhys Jessop (@Thats_Offside)

Summary

- Analytics are evolving in other fields
- Code applicable to most North American Leagues
- Ideas applicable to most leagues
- Should use to identify players to further scout for drafting
